

# Weather Station

Based on my previous experiences with development of instrumentation for fluid-mechanical applications at Dantec Dynamics A/S I have in 2025 invented a completely new way of detecting the flow direction of fluids and gasses - with a very simple implementation - without any moving parts!

To verify the principle of this new invention I have built a prototype of a complete miniature weather station (meteorological station) with Bluetooth output.

Example of output from the prototype:

Velocity (m/sec.): 6.80  
Temperature (C): 5.6  
Direction (Deg.): 256  
Pressure (hPa): 980.6  
Humidity (%): 52.7

```
      N
    00000
      o      o
    o        o
  o          o
o            o
V o          o E
o            o
o*          o
o            o
  o          o
    00000
      S
```

Directional accuracy of this prototype: less than +/-5 deg. error (in a wind tunnel)

I am now looking for companies that might be interested in using this invention in their own products.
